
Our code, in the Docker image (CPU only)
Apertus v1.5 70B, through BASE_URL
Case: a claim and its reference
the reference is a section of the booklet
1
Translate the claim
only if it is in another language than the reference
2
Scope the reference
only if it is over 2,000 characters: the 6 sentences that match best (BM25) and their neighbours, in order, with [...] between
3
Decide
on the reference shown, the claim and its translation
Prediction: the label and the evidence
the last Label: line; the reference shown, page null
Translate
the claim into the reference's language
Reason, then label
at most three sentences, then Label: <word>
